Note: These official manual pages are currently available in Japanese only.

To review the content, please use the translated manual materials provided separately, or your browser's built-in translation feature. We appreciate your understanding.

Note: In some parts of the English control panel, this service may appear as “KOUKARYOKU” instead of “High Powered.”

Both refer to the same product — “KOUKARYOKU” is the Japanese product name written in Roman letters, while “High Powered” is the English translation used in this material.

Four Ways to Use AI and GPU Resources

Choose the service based on how much of the AI and computing environment you want to manage.

	Service	What You Get	What You Manage	Best Fit	University Use Example
Ready-to-use AI model	SAKURA AI Engine Use AI through an API	Ready-to-use AI functions through an API	Your application and API requests	Using existing AI models without managing GPUs	Build AI applications using chat, embeddings, transcription, or RAG
GPU Computing Environments	High Powered DOK Run code in containers or JupyterLab	GPU containers or a ready-to-use JupyterLab environment	Your code, container image, and AI workload	Hands-on AI development and model training	Students run Python and training code directly on GPUs
	High Powered VRT (GPU) plan Use a GPU virtual machine	An independent GPU-equipped virtual machine	The virtual machine, software, and workload	Flexible and independent GPU environments	Provide each student or researcher with a separate GPU environment
	Sakura Dedicated Server PHY Use an entire physical GPU server	Exclusive use of an entire physical GPU server	The server environment, software, and workload	Large-scale computation requiring dedicated performance	Run research-lab-level model training or scientific computing

From top to bottom, you manage more of the environment yourself. This is not a ranking by performance or price.

SAKURA AI Engine

Use preconfigured AI models by simply sending requests.

No need to prepare GPUs or AI models.
Just send a request and receive an AI-generated response.

High Powered — SAKURA's GPU Cloud Lineup

Three ways to access GPU resources, depending on how you want to use them

High Powered DOK

Run workloads in containers

High Powered VRT (GPU) plan

Use a GPU-equipped virtual machine

Sakura Dedicated Server PHY

Use a dedicated physical GPU server

What is High Powered DOK?

A SAKURA service for using GPUs. It comes with **two ways to use it**.

Feature 1 Run Docker Images

Run your own custom containers on GPU.

Feature 2 Notebook (JupyterLab)

Launch an interactive environment with PyTorch and CUDA pre-installed. Experiment and iterate on your code interactively.

Classroom use case:

Students can run their own training code directly on GPU with no environment setup — ideal for hands-on exercises.

What is High Powered VRT (GPU) plan?

A SAKURA service that gives you an entire **GPU-equipped virtual machine (VM)** to use.

GPU by the hour

Spin up a VM with just the performance and duration you need.

Ready for real time

Useful not only for training, but also for workloads where you need to run and check results in real time.

Classroom use case:

Ideal for giving each student their own independent GPU environment — it only runs when started, so it fits neatly into a class schedule.

What is Sakura Dedicated Server PHY?

A SAKURA service that gives you exclusive use of an **entire physical server**.

Full performance, dedicated

No virtualization overhead, so you get the full power of the GPU.

Built for large-scale computation

The fixed configuration trades flexibility for strength in large model training and scientific/technical computing.

Classroom use case:

A good example when discussing large-scale, research-lab-level training experiments where raw performance matters most.
